# 1 Introduction

We refer to the EU22 as those countries included in the third wave of the ECB’s *Household Finance and Consumption Survey*. These are: Austria, Belgium, Cyprus, Germany, Estonia, Spain, Finland, France, Greece, Croatia, Hungary, Ireland, Italy, Lithuania, Luxembourg, Latvia, Malta, Netherlands, Poland, Portugal, Slovenia, and Slovakia. Table 1 displays the number of households which are represented in the HFCS. Across the entire sample (EU) the HFCS represents 168 million households.

We report average net wealth, percentile cut-off values and aggregate wealth for each percentile for each country and for the EU22 as a whole. We report the values obtained from the raw HFCS sample which is likely to underestimate the right tail of the wealth distribution for many countries. These results are reported in columns labelled ‘raw’. We also report these same statistics based on the dataset which we amended by a fitted Pareto tail as discussed in the full report. These results are reported in columns labelled ‘Pareto’.

All monetary values reported below, are expressed in Euros, in 2017 prices. Since the reported values represent estimates and thus are subject to statistical uncertainty, we rounded values for average wealth and percentile cut-off values to the nearest 1,000 Euro in order to avoid the impression of overly precise results.

All results are based on the concept of net wealth. This means for each household the value of all assets was calculated (*gross wealth*) and then the value of all outstanding liabilities was subtracted to obtain the household's net wealth. Wealth is calculated across five broad categories. The first is real estate assets which includes the main residence and any other real estate assets. The second asset category includes the value of self-employed and non-self-employed privately held businesses. The third category consists of current and savings accounts. The fourth category consists of financial assets such as bonds, stocks and private pension wealth held directly or in managed accounts. The fifth category includes any other assets such as cars and other valuables.

Percentiles represent 1% of the population and are arranged in descending order of net wealth. That means the 100th percentile represents the most affluent 1% of households according to their net wealth. Average wealth per percentile, reports the average net wealth for that group. The percentile cut-off value represents the first (i.e. 'poorest') household which just falls into the respective percentile and thus marks the beginning of the respective percentile. This definition implies that the percentile cut-off for the 51st percentile represents the median and the 1st percentile is simply the minimum in the dataset. Aggregate wealth per percentile represents total net wealth across all households falling into this percentile.

## 2 Tables for the EU22

Table 2: Average wealth per percentile for the EU22 in Euros

perc	raw	Pareto	perc	raw	Pareto	perc	raw	Pareto

The European Union faces the twin crises of Covid-19 and climate change. Confronting both crises requires an unprecedented volume of public resources. The question of **how to raise these funds without jeopardising a weak COVID recovery while doing so in a fair way without undermining broad political support for climate action**, poses a major political and economic challenge.

This policy study investigates **the potential of a European net wealth tax to raise substantial revenues while supporting the economy and the consensus on climate action**. To achieve this, household survey data from the European Central Bank (covering 22 EU countries) are analysed. The results show that:

- Household wealth is highly concentrated among the wealthiest households: the richest 1% hold 32% of total net wealth in the EU22 while the poorest half of all households only hold about 4.5% of total net wealth.
- A periodic tax on net wealth could raise revenues between €192 billion (1.6% of GDP) and €1,281 billion (10.8% of GDP) across the EU22 per year. Non-progressive (flat tax) designs yield revenues at the low end of this range while highly progressive designs are responsible for the high revenue estimates at the upper end of this range.

A combination of **clever design choices, more resources and better infrastructure for the EU's tax authorities would make a European net wealth tax feasible**. With respect to the tax design, high exemption thresholds between €1 million and €2 million, paired with progressive tax rates and a broad tax base, imply that only the richest 1% to 3% of all households are taxed and thus the problem of illiquid tax subjects is avoided, while keeping the revenue potential high.

This policy study shows that overall, **a European net wealth tax has the potential to make a substantial contribution to the EU's efforts to organise a decisive response to the twin crises of Covid-19 and climate change**.
